MEMORY DEALLOCATION

Once we have finished with the heap allocation, we can free it like we do in 'c' using the free library call.

```
free (ptr);
ptr = NULL;
```

In our language we write this:

```
ptr peek pop-free
0 int ptr poke
```

We must remember to free ① any structures / heap allocations using malloc ② any strings that we enter as a user.

It's important to remember that we mustn't free a block of memory that is going to be used in another function, as this will cause segmentation fault!
